

Job Control Story Report: JC1 – Install Client Side

Revision	Reason	Author	Date
0.01	Initial document	Peter Villiers	04Dec2010
0.02	Updated for PM/JECM 2.5	Ann Bagley	15Nov2012

Story Summary:

As a [customer] Installer, I want to install and configure the job controller client, so that it is able to execute.

Preconditions:

- An instance of SDD 3.5 is available and has the process manager/job control server side installed on it.
- The Installer has access to the machine on which the client application will run.
- The client machine has java 1.6.0_n (where n is any value other than 14) installed on it.
- The Installer has been provided with a zip file that contains the client side application files.

Story Path (Main):

The client side application must be deployed within the customer environment so that it can execute. This story describes how that is achieved.

1. Create a directory where the client side application will be deployed.
2. Copy/save the client side zip file into the directory.
3. Unzip the client size zip file into that directory.

Considerations / Assumptions:

None.

Test Automation:

None.

Known Limitations:

None.
